The American Psychiatric Publishing Textbook of Suicide Assessment and Management American Psychiatric Pub Charged with updating the preeminent text on suicide, the new editors of The American Psychiatric Association Publishing Textbook of Suicide Risk Assessment and Management opted not to simply revise existing chapters, but instead to steer a bold course, expanding, reconfiguring, and remaking the third edition to reflect the latest research, nomenclature, and clinical innovations. The editorial team and contributors -- two-thirds of whom are new to this edition -- have taken the intersection of suicide with both mental health and psychosocial issues as their organizing principle, exploring risk assessment and epidemiology in special populations, such as elderly patients, college students, military personnel, and the incarcerated as well as patients with a variety of psychological disorders, including bipolar spectrum, personality, depressive, anxiety, posttraumatic stress, and other disorders and schizophrenia. In addition, the book discusses treatment options (such as cognitive-behavioral therapy, dialectical behavioral therapy, and pharmacotherapy) and settings (such as emergency services, outpatient, inpatient, and civil commitment) in detail, with clinical cases to contextualize the material. The new and revised content is extensive: A chapter on the influence of sleep and sleep disorders on suicide risk has been included that considers possible mechanisms for this link and discusses practical ways of assessing and managing sleep disorders to mitigate suicide risk. Nonsuicidal self-injury, the prevalence of which is particularly high among youth, is addressed in detail, differentiating it from and comparing it to suicide attempts, discussing risk assessment, considering safety interventions, examining treatment options, and exploring suicide contagion. No text on suicide would be complete without a serious exploration of the role of social media and the internet. The book presents an update on current research as it pertains to social networking and behavior, information access, and artificial intelligence and software, and includes suggestions for clinicians treating patients at risk for suicide. Physician-assisted dying (PAD), also referred to as "aid-in-dying," is arguably a form of suicide, and the book includes a thoughtful chapter considering the ethical and practical implications of PAD, the murky professional and legal obligations that may arise, the demographics of these patients, the settings and conditions under which PAD may occur, and the role of the attendant clinicians. A number of pedagogical features are included to help the reader learn and remember the material, including key clinical concepts

and abundant case examples. Its diverse range of perspectives, broad relevance to a wide variety of clinicians, and absolutely authoritative coverage makes this new edition of The American Psychiatric Association Publishing Textbook of Suicide Risk Assessment and Management a worthy and indispensable successor.

Written by world experts in the field of bipolar disorder, *The Treatment of Bipolar Disorder: Integrative Clinical Strategies and Future Directions* provides readers with a concise and comprehensive guide to the integrative management of bipolar disorder. This resource contains 31 chapters on the various management choices available, from both established and novel treatment areas, such as psychoeducation, psychotherapeutic interventions, neuromodulatory approaches and novel therapeutic targets. Today's psychiatrists practice in an environment that poses difficult challenges. Both treatment time and duration are limited by insurance requirements; many facilities are understaffed; split treatment arrangements are typical; and high-risk, acutely suicidal patients are admitted to inpatient units for short lengths of stay. In addition, law now plays a pervasive role in the practice of psychiatry. The doctor-patient relationship is no longer defined solely by the involved parties. Clinicians must juggle these requirements and limitations while providing the very best care to their patients, especially those at high risk. Preventing Patient Suicide: Clinical Assessment and Management provides the wisdom of Dr. Robert I. Simon's vast clinical experience, combined with the latest insights from the evidence-based psychiatric literature, to offer a cutting-edge survey of suicide prevention and management techniques. The author: Addresses sudden improvement in high-risk suicidal patients, a phenomenon both common and perilous, with techniques for determining whether the improvement is real or feigned. Explores in depth the misuse of suicide risk assessment forms, with emphasis on their inherent limitations. Examines the many entrenched myths and traditions about suicide, exposing them to the critical light of evidence-based medicine, including the concept of "imminent suicide risk" and the myth of "passive suicide ideation". Discusses the continuum of chronic and acute high-risk suicidal patients, the fluidity with which one can become the other, and the difficulty in assessing these patients. Explores how the law and psychiatry interact in frequently occurring clinical situations, and the importance of therapeutic risk management. In addition, the book contains a variety of features that illuminate the subject and enhance the reader's understanding, including: Inclusion of illustrative case studies, combined with commentary on commonly occurring but complex clinical situations. Key points at the end of each chapter that identify critical information. A Suicide Risk Assessment Self-Test, a teaching instrument that consists of fifty questions designed to enhance clinician suicide risk assessment by incorporating evidence-based risk and protective factors. Dr. Simon provides a nuanced, empathic, yet pragmatic perspective on identifying, assessing, and managing the suicidal patient while successfully navigating a complex legal and clinical environment that poses its own risks to the practitioner.

"Primary care is the new frontier for preventing suicide and Bryan and Rudd are its pioneers, offering wisdom and guidance based on their experience in bridging behavioral health care to the

primary health care setting. This is a truly significant reference." Lanny Berman, PhD, ABPP Executive Director, American Association of Suicidology President, International Association for Suicide Prevention "In their pragmatic and useful book titled *Managing Suicide Risk in Primary Care*, Bryan and Rudd provide an essential reference guide for health care professionals working in primary care settings."--*PsycCRITIQUES* "This book offers a comprehensive approach that can help the physician become competent to assess and intervene with suicidal risk as well as lessen his or her anxiety when dealing with patients at suicide risk. Needless to say, this can be a life and death matter for some patients... One of the great strengths of this book is how they have adapted insights and interventions from traditional mental health care for the uniqueness of primary care... I highly recommend this book for any professional working in primary care. It will be taken off the shelf for reference and reviewed many times in the course of a career."--*Family Medicine Journal* Roughly forty-five percent of individuals who commit suicide make contact with a primary medical provider in the month prior to their death; nearly twenty percent make contact within one day of their death. This practical guide demonstrates how the primary care setting-an increasingly important provider of mental health treatment-can be an effective place for preventing suicide and providing ameliorative care. Firmly grounded in the clinical realities of primary care, Bryan and Rudd address the key issues that often plague behavioral health consultants (BHCs) in such settings where appointments are brief, patient contact is limited, and decision making and treatment are collaborative. They offer effective strategies for BHCs to manage patients across a suicidal crisis beginning with the development of procedures prior to crisis, steps to take during a crisis, planning for post-crisis care, transition to specialty mental health facilities, and legal issues. Key Features: Targets techniques for suicide assessment and prevention in primary care settings Addresses the clinical realities of working in a primary care setting and how to adapt them to the needs of suicidal patients Covers clinical protocols, legal issues, and risk management Discusses the formation of collaborative relationships with patients and staff Provides brief interventions with suicidal patients and post-crisis strategies Written by leading specialists in behavioral health, primary care, and suicidology *Suicide Risk Assessment and Prevention* Jossey-Bass *Psychiatry in Primary Care: A Concise Canadian Pocket Guide* is a comprehensive, practical resource designed to support the work of primary care providers who encounter challenging mental health problems in their daily practices. Designed for quick access, the guide features useful tools, established diagnostic criteria, useful approaches and alternatives to pharmacotherapies and other resources. Edited by David Goldbloom and Jon Davine, *Psychiatry in Primary Care* features leading contributors from across Canada.

Preventing Patient Suicide Oxford University Press

This book explores suicide prevention perspectives from around the world, considering both professionals' points of view as well as first-person accounts from suicidal individuals. Scholars around the globe have puzzled over what makes a person suicidal and what is in the minds of those individuals who die by suicide. Most often the focus is not on the motives for suicide, nor on the phenomenology of this act, but on what is found from small cohorts of suicidal individuals. This book offers a tentative synthesis of a complex phenomenon, and sheds some light on models of suicide that are less frequently encountered in the literature. Written by international experts, it makes a valuable contribution to the field of suicidology that appeals to a wide readership, from mental health professionals to researchers in suicidology and students.

For the past decade, suicidal behavior in military and veteran populations has been a constant feature in the news and in the media, with suicide rates among active duty American military personnel reaching their highest level in almost three decades. *Handbook of Military and Veteran Suicide* reviews the most advanced scientific understanding of the phenomenon of active duty and veteran suicide, while providing a useful, hands-on clinical guide for those working with this population. This comprehensive Handbook covers all relevant topics and current research in suicide in military and veteran populations, including links between suicide and PTSD, the stigma of mental health treatment in the military, screening for firearms access in military and veteran populations, "subintentioned" suicide (e.g. reckless driving and other such "accidental" deaths), women in combat, and working with families. Chapters also cover suicide risk assessment, ethical issues in treating suicidal patients, evidence-based treatments for PTSD, traumatic brain injury, and managing suicide in older veterans. Significant issues that may arise in assessing and treating military and veteran populations who are at risk for suicide are presented and discussed with evidence-based and practical recommendations. This Handbook will benefit researchers, policy makers, and clinicians who work with active duty military and veteran populations.

Advances in Patient Safety Createspace Independent Pub

Each year almost 30,000 individuals take their own lives, making suicide the eighth leading cause of death in the United States. The data on completed suicide become all the more disturbing when one considers that completed suicides represent only a small percentage of the number of attempts; that suicide may be statistically underreported; and that the rates of suicide in many industrialized countries are increasing. Suicide has likewise been found to be the most frequently encountered emergency situation for mental health professionals, with clinicians consistently ranking work with suicidal patients as the most stressful of all clinical endeavors. Combining the clinical experience and practical recommendations of some of the world's foremost authorities on suicidal and life-threatening behaviors, *Suicide: Guidelines for Assessment, Management, and Treatment* is designed to fill current gaps in the training efforts of the mental health and health care professions in teaching clinicians how best to work with suicidal patients. The chapters are constructed as modules that cover a specific topic in a basic curriculum on suicidology and include workable practice guidelines that are both essential and up-to-date. Topics include theories of suicide; epidemiology of suicide; biological research; understanding child and youth suicide and suicide among the elderly; procedures for detection of high-risk factors; emergency room care; hospitalization and its alternatives; psychopharmacological treatments; psychological assessment; cognitive and psychodynamic approaches to working with suicidal patients; training and supervision of mental health professionals in the study of suicide; postvention, malpractice, and risk management; and forensic issues in suicidology. By bringing together in one landmark volume the cumulative clinical wisdom of many of the pre-eminent experts in suicidology, this book for the first time provides the practitioner and practitioner-in-training with a set of clear and useful guidelines for working with the suicidal patient in clinical practice. As such it will have broad appeal to psychologists, psychiatrists, social workers, marriage and family therapists, and other mental health professionals, as well as to primary care physicians, nurses, and other health care professionals.
