of Medical Reviews American Chemical Society Issues in Aging combines social, psychological, biological, and philosophical perspectives to present a multifaceted picture of aging. Novak illustrates both the problems and the opportunities that accompany older age. This text helps students understand the tremendous variability in aging and

introduces them to careers working with older adults. This new edition reflects the continued changes in the way we age. The fourth edition has been updated to include emerging issues in aging. These include the prevalence of HIV/AIDs in later life, current research on mental potential in old age, the creation of age-friendly cities, and new options for end-of-life

care. Each chapter begins with a set of learning objectives to guide students in their reading, and concludes with a list of main points, questions for discussion or study, suggested readings, and relevant web sites to consult. Each chapter also includes up-to-date charts and graphs as well as key terms to help students understand the issues presented. Break out boxes reveal the human

side of aging through the stories of individuals in real life and in the media.

Royal Society of Chemistry Remote health monitoring using wearable sensors is an important research area involving several key steps: physiological parameter sensing and data acquisition, data analysis, data security, data transmission to caregivers, and clinical intervention, all of which play a significant role to form a closed loop system. Subject-

specific behavioral and clinical traits, coupled with individual physiological differences, necessitate a personalized healthcare delivery model for around-the-clock monitoring within the home environment. Cardiovascular disease monitoring is an illustrative application domain where research has been instrumental in enabling a personalized closed-loop monitoring system, which has been

showcased in this book. Health Monitoring Systems: An Enabling Technology for Patient Care provides a holistic overview of state-of-the-art monitoring systems facilitated by Internet of Things (IoT) technology. The book lists out the details on biomedical signal acquisition, processing, and data security, the fundamental building blocks towards an ambulatory health

monitoring infrastructure. The fundamentals have been complimented with other relevant topics including applications which provide an in-depth view on remote health monitoring systems. Key Features: Presents examples of state-of-the-art health monitoring systems using IoT infrastructure. Covers the full spectrum of physiological sensing, data acquisition, processing,

and data security. Provides relevant example applications demonstrating the benefits of technological advancements aiding disease prognosis. This book serves as a beginner's guide for engineering students of electrical and computer science, practicing engineers, researchers, and scientists who are interested in having an overview of pervasive health monitoring

systems using body-worn sensors operating outside the hospital environment. It could also be recommended as a reference for a graduate or master's level course on biomedical instrumentation and signal processing.
