For courses in Biological Anthropology Present a concise overview of biological anthropology, from early foundations to recent innovations Exploring Biological Anthropology: The Essentials combines concise coverage of the foundations of the field with modern innovations and discoveries, helping students understand, and get excited about, the discipline. Because the authors conduct research in three of the main areas of biological anthropology—the human fossil record (Susan Antón), primate behavior and ecology (Craig Stanford), and human biology and the brain (John Allen)—they offer a specialist approach that engages students and gives them everything they need to master the subject. The Fourth Edition continues to present traditional physical anthropology within a modern Darwinian framework, and includes coverage of contemporary discoveries to highlight the ever-increasing body of knowledge in biological

anthropology. Also available with MyAnthroLab® MyAnthroLab for the Biological Anthropology course extends learning online to engage students and improve results. The Hunting Apes Harvard University Press

Anthropology is the study of all humans in all times in all places. But it is so much more than that. "Anthropology requires strength, valor, and courage," Nancy Scheper-Hughes noted. "Pierre Bourdieu called anthropology a combat sport, an extreme sport as well as a tough and rigorous discipline. ... It teaches students not to be afraid of getting one's hands dirty, to get down in the dirt, and to commit yourself, body and mind. Susan Sontag called anthropology a "heroic" profession." What is the payoff for this heroic journey? You will find ideas that can carry you across rivers of doubt and over mountains of fear to find the light and life of places forgotten. Real anthropology cannot be contained in a book. You have to go out and feel the world's jagged edges, wipe its dust from your brow, and at times, leave your blood in its soil. In this unique book, Dr. Michael Wesch shares many of his own adventures of being an anthropologist and what the science of human beings can tell us about the art of being human. This special first draft edition is a loose framework for more and more complete future chapters and writings. It serves as a companion to anth101.com, a free and open resource for instructors of cultural anthropology. This 2018 text is a revision of the "first draft edition" from 2017 and includes 7 new chapters.

Anthropology For Dummies Harvard University Press
THE ESSENCE OF ANTHROPOLOGY features an experienced and diverse author team with expertise in all subfields of anthropology. With an eye to visual and written clarity, the authors present anthropology from an integrated, holistic perspective. They use three unifying themes as a framework to tie the book together and keep students focused: systemic adaptation to emphasize that every culture, past and present, is an integrated and dynamic system of adaptation; biocultural connections that highlight the integration of human culture and biology in the steps humans take to meet the challenges of survival; and the emergence of globalization and its disparate impact on peoples and cultures around the world. Pedagogical elements support these main themes and give deeper insight into the meaning and relevance of a wide range of topics covered in the general narrative by tying examples to behavior today. Insightful questions foster critical thinking, additional Visual Counterpoints widen the book's array of compare-and-contrast examples, and a new Digging into Anthropology feature provides a hands-on approach to anthropological methods by giving active learning opportunities related to each chapter's content. In addition, the authors have broadened viewpoints to offer explanations and examples from different points of view. The Essentials W. W. Norton

What makes humans unique? What makes us the most successful animal species inhabiting the Earth today? Most scientists agree that the key to our success is the unusually large size of our brains. Our large brains gave us our exceptional thinking capacity and led to humans' other distinctive characteristics, including advanced communication, tool use, and walking on two legs. Or was it the other way around? Did the challenges faced by early humans push the species toward communication, tool use, and

walking and, in doing so, drive the evolutionary engine toward a large brain? In this provocative new book, Craig Stanford presents an intriguing alternative to this puzzling question--an alternative grounded in recent, groundbreaking scientific observation. According to Stanford, what made humans unique was meat. Or, rather, the desire for meat, the eating of meat, the hunting of meat, and the sharing of meat. Based on new insights into the behavior of chimps and other great apes, our now extinct human ancestors, and existing hunting and gathering societies, Stanford shows the remarkable role that meat has played in these societies. Perhaps because it provides a highly concentrated source of protein--essential for the development and health of the brain--meat is craved by many primates, including humans. This craving has given meat genuine power--the power to cause males to form hunting parties and organize entire cultures around hunting. And it has given men the power to manipulate and control women in these cultures. Stanford argues that the skills developed and required for successful hunting and especially the sharing of meat spurred the explosion of human brain size over the past 200,000 years. He then turns his attention to the ways meat is shared within primate and human societies to argue that this all-important activity has had profound effects on basic social structures that are still felt today. Sure to spark a lively debate, Stanford's argument takes the form of an extended essay on human origins. The book's small format, helpful illustrations, and moderate tone will appeal to all readers interested in those fundamental questions about what makes us human.

Can we live with the consequences of wiping our closest relatives off the face of the Earth, and all the biological knowledge about ourselves that would die along with them? Extinction of the great apes threatens to become a reality within a few human generations. Stanford tells us how we can redirect the course of an otherwise bleak future.
