Introduction to the Cellular and Molecular Biology of Cancer
Springer Science & Business Media

Focuses on recent key discoveries made relating to the cell cycle and its regulation - a critical new horizon in therapeutics. Research into all aspects of cell cycle regulation has undergone explosive growth during the past decade due to the powerful techniques of molecular biology. An overall view of the cellular processes, both at the enzymatic and genetic level, has been identified in continually finer detail, as described inside this text. This has enabled significant progress in the identification of drugs capable of acting on specific components of the cell cycle, with the result that we may soon have the ability to manipulate the cell cycle pharmacologically. The potential impact on clinical conditions such as cancer, hematopoiesis, angiogenesis, inflammation, organ remodelling and apoptosis is vast. Originating from presentations at the Eighth SmithKline Beecham Pharmaceuticals United States Research Symposium, each chapter in this volume is written by an opinion leader in the field.

This series is dedicated to serve as a collection of reviews on various aspects of the cell division cycle, with special emphasis in less studied aspects. This fourth volume starts with a review of RAS pathways and how they impinge on the cell cycle (chapter 1). In chapter 2, an overview is presented of the links between

cell anchorage - cytoskeleton and cell cycle progression. A model of the G1 control in mammalian cells is provided in chapter 3. The role of histone acetylation and cell cycle control is described in chapter 4. Then follow a few reviews dedicated to specific cell cycle regulators: the 14-3-3 protein (chapter 5), the cdc7/Dbf4 protein kinase (chapter 6), the two products of the p16/CDKN2A locus and their link with Rb and p53 (chapter 7), the Pho85 cyclin-dependent kinases in yeast (chapter 9), the cdc25 phosphatase (chapter 10), RCC1 and ran (chapter 13). The intriguing phosphorylation-dependent prolyl-isomerization process and its function in cell cycle regulation are reviewed in chapter 8.

Molecular Cell Biology of the Growth and Differentiation of Plant Cells encompasses cell division, cell enlargement and differentiation; which is the cellular basis of plant growth and development. Understanding these developmental processes is fundamental for improving plant growth and the production of special plant products, as well as contributing to biological understanding. The dynamics of cells and cellular organelles are considered in the context of growth and differentiation, made possible particularly by advances in molecular genetics and the visualization of organelles using molecular probes. There is now a much clearer understanding of these basic plant processes of cell division, cell enlargement and differentiation. Liver metastases are a frequent and often fatal occurrence in cancer patients, particularly those with malignancies of the gastrointestinal (GI) tract. While recent improvements in surgical techniques and a more aggressive approach to resection of liver metastases have improved long term survival for some patients, most patients with hepatic metastases still succumb to their disease. To improve these dismal statistics, a better understanding of the biology of liver metastasis, particularly the

early stages that can be targeted for prevention, is essential. Once cancer cells enter the liver, several different scenarios may occur. The cancer cells may be immediately destroyed by local defence mechanisms, they may enter a state of dormancy as solitary cells and never produce a metastasis, initiate a short-lived process of proliferation that is aborted before a metastasis is established or actively proliferate to form macrometastases. The chapters in Part I of this book provide insight into the cellular/molecular mechanisms that determine which of these scenarios prevails. Written by experts researchers in the field of metastasis, these chapters provide state-of-the art reviews on the cellular and molecular processes that impact the early stages of the metastatic process. The unique microenvironment of the liver, its various anatomical, cellular and molecular features and the impact they have on metastasis are highlighted. In addition, the role of inflammation (pre-existing and tumor-induced), host innate and adaptive immune responses, cytokines, chemokines, growth factors and the unique molecular signatures of metastatic tumor cells are reviewed with an underscoring of the translational implications of the current state of knowledge. Against this background, the chapters in Part II of the book provide critical reviews on major aspects of the clinical management of hepatic metastases. These include imaging strategies, surgical and chemotherapeutic treatment approaches and the use of targeted biological therapeutics such as anti-angiogenic drugs as treatment modalities. By combining information on biological and clinical aspects of liver metastasis, this volume will serve as an excellent resource for scientists, clinicians, clinician/ scientists and trainees in the domains of oncology, surgical oncology,

hepatobiliary physiology and radiology.

Biology of the Prokaryotes New Age International

Quantum biology is a wide area of research closely connected with almost all parts of biology. It is based on experimental data of biological sciences and the fundamental laws of physics (de Broglie law of corpuscular-wave dualism of the matter, the conservation laws, including the laws of thermodynamics). At this time, our knowledge in this area is fragmentary. The usual corpuscular biology studies only one plane of living matter organization, the structure and function of which is determined by the DNA-particle. That is why the theory often does not agree with experience, the physics laws don't work. It leads to frequent changes of concepts. Many phenomena (division of living matter into cells, restoration and loss of totipotency of cell systems, etc.) do not find an explanation within the corpuscular theory framework. This book includes nine chapters. In Chapter 1 the insight of a cell as a quantum-mechanical system, an equilibrium system, an open and closed system; the notion of biological harmonic oscillator, as an elementary and indivisible unity of the wave properties of a living matter; the principle and regimes of

oscillator work in plants; two internal energy sources and their physical nature; the role of DNA-particles and DNA-wave at different hierarchical levels of living matter organization are discussed. In Chapter 2 the changes of DNA particles, DNA-waves, the cell physical state, its basic components and physiological functions are analyzed during cell cycle of proliferating plant cell. In Chapter 3 seven types of cell division (mitosis, differentiative mitosis, free-nucleus mitosis, meiosis, endomitosis, crushing and promitosis) are described. The dependence of the principle of prokaryotic and eukaryotic cell development from its condition is shown in Chapter 4. In Chapter 5 physical models of gamete sexual differentiation and fertilization are considered. The manifestation of the law of total impulse conservation in evolution processes is examined in Chapter 6. In Chapter 7 the mechanisms and manners of biological protection and the reasons for their change during evolution are discussed. How and why a DNA-particle and a DNA-wave change during reproductive development of future plant initial cells is described on *Pinus sylvestris* L. example in Chapter 8. In Chapter 9 a short overview of quantum biology tasks and problems is given.

By focusing on the cellular mechanisms that underlie ontogeny, phylogeny and regeneration of complex physiologic traits, *Evolution, the Logic of Biology* demonstrates the use of homeostasis, the fundamental principle of physiology and medicine, as the unifying mechanism for evolution as all of biology. The homeostasis principle can be used to understand how environmental stressors have affected physiologic mechanisms to generate condition-specific novelty through cellular mechanisms. *Evolution, the Logic of Biology* allows the reader to understand the vertebrate life-cycle as an intergenerational continuum in support of effective, on-going environmental adaptation. By understanding the principles of physiology from their fundamental unicellular origins, culminating in modern-day metazoans, the reader as student, researcher or practitioner will be encouraged to think in terms of the prevention of disease, rather than in the treatment of disease as the eradication of symptoms. By tracing the ontogeny and phylogeny of this and other phenotypic homologies, one can perceive and understand how complex physiologic traits have mechanistically evolved from their simpler ancestral and developmental origins as cellular structures and functions, providing a logic of biology for the first time. *Evolution, the Logic of Biology* will be an

invaluable resource for graduate students and researchers studying evolutionary development, medicine and biology, anthropology, comparative and developmental biology, genetics and genomics, and physiology.

Essential Cell Biology Concepts of Biology Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand. We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts. Cell Growth and Cell Division

Essential Cell Biology provides a readily accessible introduction to the central concepts of cell biology, and its lively, clear writing and exceptional illustrations make it the ideal textbook for a first course in both cell and molecular biology. The text and figures are easy-to-follow, accurate, clear, and engaging for the introductory student. Molecular detail has been kept to a minimum in order to provide the reader with a cohesive conceptual framework for the basic science that underlies our current understanding of all of biology, including the biomedical sciences. The Fourth Edition has been thoroughly revised, and covers the latest developments in this fast-moving field, yet retains the academic level and length of the previous edition. The book is accompanied by a rich package of online student and instructor resources, including over 130 narrated movies, an expanded and updated Question Bank. Essential Cell Biology, Fourth Edition is additionally supported by the Garland Science Learning System. This homework platform is designed to evaluate and improve student performance and allows instructors to select assignments on specific topics and review the performance of the entire class, as well as individual students, via the instructor dashboard. Students receive immediate feedback on their mastery of the topics, and will be better prepared for lectures and classroom discussions. The user-friendly system provides a convenient way to engage students while assessing progress. Performance data can be used to tailor classroom discussion, activities, and lectures to address students' needs precisely and efficiently. Cancer is a broad group of diseases involving unregulated cell growth, in which cells divide and grow uncontrollably, forming malignant tumors, and invade nearby parts of the body. Cancer may also spread to different parts of the body through the lymphatic system or the bloodstream. The Research and Biology of Cancer discusses some recent advances in cancer research. There are totally two volumes: Volume I mainly discusses the roles of some important enzymes and proteins in cancers, whereas Volume II discusses different types of cancers, including head and neck cancer, oral cancer, kidney cancer, colon cancer, and thyroid cancer. Chapter 1 discusses a detailed role for Heme oxygenase-1 (HO-1) in cancer and as essential for appropriate DNA repair and maintenance of homeostasis. Chapter 2 describes the role of endothelial nitric oxide synthase (eNOS) and NO in tumorigenesis through regulation of angiogenesis, vascular permeability, cellular proliferation and apoptosis. Chapter 3 outlines the significant role macropinocytosis, a high-capacity variant of endocytosis, has in cancer biology. Chapter 4 reviews the anticancer role of phosphodiesterase-5 inhibitors. Emerging evidence shows that PDE5 inhibitors not only have direct anticancer activity but also can enhance the sensitivity of cancers to chemotherapy. Chapter 5 summarizes the current knowledge on Manumycin A as a potential natural anticancer agent and provides an overview of research done on this compound in various experimental systems. Chapter 6 evaluates the functional roles of CD44 in stem cells and CSCs and describes the known differences in CD44 expression and their roles. Chapter 7 discusses role of HMGB1 in cancer. HMGB1 dysfunction is associated with each hallmark of cancer and contributes to

cancer development and therapy. Chapter 8 presented a TNF- α mutant by gene engineering technology, which aims at increasing the specific anti-tumor activity and decreasing the toxicity of TNF- α . The novel protein RGD4C-rmhTNF maintains the well tolerance characteristics of rmhTNF- α and gains tumor-specific delivery ability. This strategy presents a great therapeutics potential and advantages for treating cancers. Chapter 9 proposes an understanding of the biology of myeloid-derived suppressor cells (MDSCs) and their related cell subpopulations. Chapter 10 proposes altered morphology as an essential feature of carcinogenic process. The role of the tissue microenvironment is emphasized as a driving force in the early stages of neoplastic disease. Chapter 11 reviews the role of mitochondria in cell stress response focusing on mitochondrial involvement in anti-apoptotic and pro-survival pathways. Emphasis is given on yeast *Saccharomyces cerevisiae* as a model organism to further elucidate molecular mechanisms of these processes. Chapter 12 highlights the roles of FKBP51 in apoptosis resistance and cancer progression. FKBP51 is a multifunctional protein highly conserved across the species, particularly expressed in developmental stages, both in mammals and inferior organisms. Chapter 13 proposes a novel regulatory mechanism of ribosomal protein RPL26 to activate p53 by inhibiting HDM2. RPL26 modulates the HDM2-p53 interaction by forming a ternary complex among RPL26, HDM2 and p53, which stabilize p53 through inhibiting the ubiquitin ligase activity of HDM2. Chapter 14 discusses molecular imaging. Molecular imaging employing ^{18}F FDG-PET/CT enables in vivo characterization of biological process in tumour at the molecular

level beyond the capability of the conventional imaging methods. Chapter 15 proposes an application of high-throughput miRNAs technologies and computational analysis to characterize the regulatory network of cancer. Chapter 16 presents a model which incorporates cell cycle modeling into ionizing radiation induced tumor transformation frequency.
