A remarkable look at how the growth, technology, and politics of high-frequency trading have altered global financial markets In today's financial markets, trading floors on which brokers buy and sell shares face-to-face have increasingly been replaced by lightning-fast electronic systems that use algorithms to execute astounding volumes of transactions. Trading at

the Speed of Light tells the story of this epic transformation. Donald MacKenzie shows how in the 1990s, in what were then the disreputable margins of the US financial system, a new approach to trading—automated high-frequency trading or HFT—began and then spread throughout the world. HFT has brought new efficiency to global trading, but has also created an unrelenting race for speed, leading to a systematic, subterranean battle among HFT algorithms. In HFT, time is measured in nanoseconds (billionths of a second), and in a nanosecond the fastest possible signal—light in a vacuum—can travel only thirty centimeters, or roughly a foot. That makes HFT exquisitely sensitive to the length and transmission capacity of the cables connecting computer servers to the exchanges' systems and to the location of the microwave towers that carry signals between computer datacenters. Drawing from more than 300 interviews with high-frequency traders, the people who supply them with technological and communication capabilities, exchange

staff, regulators, and many others, MacKenzie reveals the extraordinary efforts expended to speed up every aspect of trading. He looks at how in some markets big banks have fought off the challenge from HFT firms, and how exchanges sometimes engineer technical systems to favor certain types of algorithms over others. Focusing on the material, political, and economic characteristics of high-frequency trading, *Trading at the Speed of Light* offers a unique glimpse into its influence on global finance and where it could lead us in the future.

Consistent, benchmark-beating growth, combined with reduced risk, are the Holy Grail of traders everywhere. Laurens Bendsorp has been achieving both for more than a decade. By combining multiple quantitative trading systems that perform well in different types of

markets--bull, bear, or sideways--his overall systematized and automated system delivers superlative results regardless of overall market behavior. In his second book, *Automated Stock Trading Systems*, Bendsorp details a non-correlated, multi-system approach you can understand and build to suit yourself. Using historical price action to develop statistical edges, his combined, automated systems have been shown to deliver simulated consistent high double-digit returns with very low draw downs for the last 24 years, no matter what the market indices have done. By following his approach, traders can achieve reliable, superlative returns without excessive risk.

Corruption presents a fundamental threat to the stability and prosperity of Mexico and combating it demands approaches that are both principled and practical. In 2017, the Inter-American Development Bank (IDB) approved project ME-T1351 to support Mexico in its fight against

corruption using Open Innovation. Thus, the IDB partnered with the Governance Lab at NYU to support Mexico's Secretariat of Public Service (Secretaría de la Función Pública) to identify innovative solutions for the measurement, detection, and prevention of corruption in Mexico using the GovLab's open innovation methodology named Smarter Crowdsourcing. The purpose of Smarter Crowdsourcing was to identify concrete solutions that include the use of data analysis and technology to tackle corruption in the public sector. Although written at the behest of and for the Mexican context, the recommendations and plans for their implementation developed in this report could be adapted for use in other countries. This document contains 13 implementation plans laying out practical ways to address corruption. The plans emerged from "Smarter Crowdsourcing Anti-Corruption" (2017). The Smarter Crowdsourcing method is an agile process, which begins with robust problem definition followed by online

sourcing of global expertise to surface innovative ideas and then turns them into practical implementation plans.

An experimental new Internet-based form of money is created that anyone can generate at home; people build frightening firetrap computers full of video cards, putting out so much heat that one operator is hospitalised with heatstroke and brain damage. A young physics student starts a revolutionary new marketplace immune to State coercion; he ends up ordering hits on people because they might threaten his great experiment, and is jailed for life without parole. Fully automated contractual systems are proposed to make business and the law work better; the contracts people actually write are unregulated penny stock offerings whose fine print literally states that you are buying nothing of any value. The biggest crowdfunding in history attracts \$150 million on the promise that it will embody “the steadfast iron will of unstoppable code”; upon release it is immediately hacked, and \$50 million is stolen. How did we get here? David Gerard covers the origins and history of Bitcoin to

the present day, the other cryptocurrencies it spawned including Ethereum, the ICO craze and the 2017 crypto bubble, and the attempts to apply blockchains and smart contracts to business. Plus a case study on blockchains in the music industry. Bitcoin and blockchains are not a technology story, but a psychology story. The real-life trades and strategies of a successful cryptocurrency trader Glen Goodman's goal was to retire young and wealthy, escaping the daily grind. He taught himself how to trade everything from shares to Bitcoin and made enough

money to realise his dream and quit his day job while still in his 30s. In *The Crypto Trader*, Glen will show you exactly how he made huge profits trading Bitcoin, Ethereum, Ripple and more, so that you can do it too - without risking your shirt. Glen publicly called the top of the market in December 2017 and took his profits before the crash. But there are still tons of trading opportunities out there and Glen continues to trade crypto successfully. Inside you'll see his multi-hundred-percent gains on a raft of cryptocurrencies and learn how he builds his profits and holds onto them. Glen reveals all his trading strategies, the proven methods and rules that make him one of the most followed traders in the world on social media. (He is also frequently interviewed by the BBC, Forbes and LBC, and is a contributing expert on cryptocurrency at the London School of Economics.) It took Glen years of study and trial and error to become a consistent money maker. He learnt his trading lessons the hard way - so you don't have to. With *The Crypto Trader* by your side, you'll learn how to grab opportunities, make

money - and keep it. **Wiley CIA 2022 Exam Review, Part 3** John Wiley & Sons
Technology is changing money: it has been transformed from physical objects to intangible information. With the arrival of smart cards, mobile phones and Bitcoin it has become easier than ever to create new forms of money. Crucially, money is also inextricably connected with our identities. Your card or phone is a security device that can identify you - and link information about you to your money. To see where these developments might be taking us, David Birch looks back over the history of money, spanning thousands of years. He sees in the past, both recent and ancient, evidence for several possible futures. Looking further back to a world before cash and central banks, there were multiple 'currencies' operating at the level of communities, and the use of barter for transactions. Perhaps technology will take us back to the future, a future that began back in 1971, when money became a claim backed by reputation rather than by physical commodities of any kind. Since then,

money has been bits. The author shows that these phenomena are not only possible in the future, but already upon us. We may well want to make transactions in Tesco points, Air Miles, Manchester United pounds, Microsoft dollars, Islamic e-gold or Cornish e-tin. The use of cash is already in decline, and is certain to vanish from polite society. The newest technologies will take money back to its origins: a substitute for memory, a record of mutual debt obligations within multiple overlapping communities. This time though, money will be smart. It will be money that reflects the values of the communities that produced it. Future money will know where it has been, who has been using it and what they have been using it for. *Internet of Things in Business Transformation* Springer

denisaBot/ Algorithms and Automation: Governance over Rituals, Machines, and Prototypes, from Sundial to Blockchain is a critical examination of the history and impact of automation on society. It provides thought-provoking perspectives on the history of automation and its relationship with power, emphasizing the importance of considering the social context in which automation is developed and used. The book argues that automation has always been a political and social

force that shapes our lives and futures, rather than a neutral tool. The author provides a genealogy of automation, tracing its development from ancient rituals to modern-day prototypes, and highlights the challenges posed by new technologies such as blockchain and artificial intelligence. The volume argues that we need more democratic and accountable governance over technological innovation to ensure that it respects human rights, political pluralism, legitimacy, and other values we hold dear in our

institutions and political processes. An engaging read on a fascinating topic, this book will be indispensable for scholars, students, and researchers of science and technology studies, digital humanities, politics and governance, public policy, social policy, system design and automation, and history and philosophy of science and technology. It will also be of interest to readers interested in the interactions of the sciences and the social sciences and humanities.
