Publisher Introduction If you start a
discussion on hydroponics with a person
who is a keen and an avid gardener, he
is going to say in a very blase tone, "Oh
yeah, you are talking about a gardening
method which you are not going to use
any soil at all. In fact, you are going to
be growing your plants in water." And he
is going to be so right. Hydroponics is
that gardening method, in which you are
going to grow your plants in lots of
water. This gardening method is
normally implemented in places where
the soil is not fertile enough to sustain
plant life. I, being a practical doomsayer,
predict that within the next 50 years
plants are going to be grown extensively
through hydroponics because we will

have poisoned all the soil, with our
chemicals, by then. The idea of
hydroponics is not something new. I
would not be surprised if in ancient
times plants were grown in water,
especially in places where one wanted to
grow plants indoors - especially in
palaces. By the way, a couple of years
ago, archaeologists who were doing a
little bit of digging in Egypt found some
Lotus and water Lily seeds going back
more than 2,000 years ago, in some
pond excavations in a palace in ancient
Egypt. Out of the 20 buried seeds found,
which were sent to Kew Gardens London,
three of them germinated, and so we
have 2,000-year-old lilies, whose
ancestors were collected by Egyptian
princesses. The princesses in the palace
collected the lotuses every day in the

ponds and use them for religious rituals as well as adorning their rooms and persons. I do not think they went bathing in the scented waters, because they must have been really careful about the muddy and dirty waters, especially with natural organic fertilizers put in them to promote the growth of the plants."

vegetables, fruits, and herbs, but don't have so much space outside? Are you tired of having to spend money on fruit and vegetables, with the risk that they are genetically modified and treated with pesticides and toxic chemicals? Do you want to know how to start growing plants through an environmentally friendly method? Among modern methods of growing crops, Hydroponics occupies a special place because of the many benefits it offers. It is nothing more than means the cultivation of plants without soil but in water. And the water is enriched with nutrients. The history of the emergence of hydroponics is associated with centuries of research by scientists, as a result of which a huge number of experiments were carried out that made it possible to determine the

optimal balanced nutritional composition to ensure the vital activity of plants. As it turned out, the soil environment for crops is not necessary: plants successfully grow and develop if their root system is in contact with an aqueous medium containing all the necessary substances. This fact became fundamental for the development of hydroponics as a new method of crop production. Through hydroponics, you no longer have to worry about removing weeds, and fighting pests in the soil. Plants that grow in a hydroponic system are healthier and grow faster. Another advantage is that through specific extensions, a hydroponic system can also be supplied semi-automatically or fully automatically. Therefore, it is particularly suitable for those who do not

have a large garden, guaranteeing perfect results. Hydroponics is important as its further development and improvement of which will help solve the global problems of humankind, including the most significant among them - providing food to an ever-growing number of people on our planet. All these factors confirm the need to search for new, more effective methods of growing crops, one of which is hydroponics. In this book we will discuss the following topics: How hydroponic gardening works - Growing plants without soil How to build your own hydroponic system Clarification of understandings of different types of hydroponic gardens The different types of hydroponic systems and their pros and cons Choosing the right hydroponic

Hydroponic fodder is a cultivation of nutritious green fodder (grass) in water medium with added nutrients in it. Basically seeds like Barley, Oats, Maize, Wheat, Jowar, Bajra are sprouted into high quality green fodder within a period of 7-9 days in a specific given condition in this system. Due to absence of soil medium in this system nutrients are directly supplied to the roots of plants in a specific condition of water, hence plants do not need to spend extra energy in search of nutrients, due to this reason growth in fodder is very quick and fast as compared with other fodder grown in soil medium. Normally fodder grown in 7-8 day stage is full of nutrition and enzymes in it.

you want to grow your own vegetables, fruits, and herbs, but don't have so much space outside? Are you tired of having to spend money on fruit and vegetables, with the risk that they are treated with pesticides and toxic chemicals? Do you want to learn how to start growing plants through an environmentally friendly method? If yes, then keep reading. Hydroponic gardening is your significance of growing plants without using soil. Hydroponic plants have been developed in soapy solutions. All these water solutions comprise the majority of the minerals and additives for plants to grow. Typically, you can develop hydroponic plants directly from the nutrient solution. Alternately plants may be implanted in an inert growing medium like coconut fibers, rock wool,

growing stone, etc. Hydroponic growing isn't only a favorite hobby pastime; nevertheless, it has become a flourishing small business. When the gardening abilities and methods are mastered precisely, it's possible to literally grow any plant since you need with the hydroponic procedure. By means of a semi-automatic system, you can simply establish a hydroponic garden or halfway within your home or on the roof top. When hydroponic gardening procedure is required on a huge scale, this can grow to be an extremely productive means to make plants for commercial usage. Unlike developing plants using traditional soil gardening, the main system of blossom plants doesn't need to look for minerals and nutrients from land. All of the naturally-occurring

minerals and nutrients are given in the nutrition solution, readily to be furnished into the origin system. For that reason, plants can concentrate on top growth to create more blossoms and fruits as opposed to implementing energy to look for nourishment. In hydroponic gardening, both carbon and oxygen compounds will also be supplied into the nutrient solution to improve the uptake of nutrients by the main systems. This can help to market faster growth levels and wholesome development of these plants. Besides that, you'll also possess significantly less problem with plant pest and diseases if growing plants together with hydroponic procedures. Because the majority of the plant pest and diseases problems are connected by means of dirt. This book covers the

following topics: What is Hydroponics? How Hydroponic Garden works Different types of Hydroponic Garden Best Plants for Hydroponic Gardening The Growth Medium Features of a Hydroponic System Different types of Hydroponic System Choosing the right Hydroponic System Equipment Choosing the right Site for your Garden How to build your own Hydroponic System Plant Nutrition System Maintenance Common Problems and Troubleshooting Safeguards Hydroponic plants would be those that are increased in water. This system is becoming more and more popular nowadays because they usually do not require considerable quantities of water gear and also farm lands which are extraordinarily fertile. Home gardeners and hobby farmers make use of this

approach to grow more vegetables during the season. There are a lot of explanations as to why hydroponic plants have gotten so common.

Book description: Have you thought

about how your own fruits and vegetables can grow without taking up too much space? Do you think all methods of farming are costly, except soil-based ones? We want to depend on ourselves at some point in our lives when it comes to growing diverse plants. It is about the way our ancestors lived. They ate only that which they caught or that which they grew. But, whether you live in a house that doesn't have a large yard or you do have one, but you're not physically powerful enough to work in the field every day, there's a way you can easily get your own plants. The answer is HYDROPONIC. Hydroponics is a plant growing system inside a soil-free medium. Hydroponic systems are very basic, and they work by connecting the plant's root with the water-dissolved

nutrient solution. Here is what you will learn in this book: What is Hydroponics? The History of Hydroponics Different forms of hydroponics. Difference between Growing Organic Herbs, Vegetables and fruits in Soil and Water Tools and Equipment required to grow plants in water Choosing the right System of Hydroponics System How to Build your own system This book tells you that hydroponics systems are very easy, and you don't need to spend too much time building them. The benefit of hydroponics is the fact that you can take advantage of your imagination. Plus, during the year, you will be able to expand production. This is going to save you a lot of time.

Hydroponics is the study of soilless plants. You might have heard of soil-less society, which is another term often used to explain the same thing when you haven't heard about the hydroponics. The same natural elements are used to grow plants in soils, so that weeds, soil-borne pests, and diseases do not harm the plants. Once a plant has been developed, its production is higher than average, whether it is grown in a greenhouse, a garden or a balcony. Hydroponics also helps you to become more plants per square meter. Since plants don't have to compete with weeds and each other for the food and water in the soil, they are supplied with food and water directly. Moreover, although many myths, plants are grown in hydroponics

are not different from plants growing in the soil, their physiology is similar. Plants cultivated in a hydroponic system take the same nutrients as those produced in the land, but the quality can be regulated more precisely. The fundamental difference between the two approaches is how plants are supplied with nutrients and water. Nutrient salts are already processed in hydroponics, and plants do not have to wait before nutrients fall into the necessary form. For soil agriculture, however, plants are fed nutrients by means of manure and compost, which must be broken down into their basic shape (nutrient salts) before they can be used by plants. Hydroponics is now starting to play a more significant role in agricultural production around the world. Hydroponic

gardening has been widely used since the 1970s, but it has become more accessible for the household grower only recently. Demand for environmentally friendly and safer goods in society has been an essential factor in this development. If you're interested in hydroponics, then this book is for you. This book covers: What is Hydroponics? Hydroponic and the Science Why Choose Hydroponics? Advantages and Disadvantages of a Hydroponics System Types of Hydroponics Growing Systems Necessary Equipment to Build Your Own Hydroponic System Choosing the Best Lighting Medium for Your Hydroponic Plants Starting Your Seeds The Best Plants to Grow Using Hydroponics How to Maintain Your Hydroponic System Tips and Tricks to Growing Healthy Herbs,

★ Did you know growing your own food is both environmentally friendly and healthier than most other forms of food? Hydroponic gardening uses water and nutrients to grow crops instead of soil, so it's far more efficient than traditional gardening. Because they're mass produced in a controlled environment, each crop requires fewer resources for growing. As a result, hydroponic farming is less damaging to the environment overall. Most hydroponic crops are grown in soil-free trays called "compots", which are replenished by watering the roots of the plants. This means no soil needs to

be removed from the ground for growing plants. It also reduces the amount of waste created during the process.

Hydroponic gardens can even be used for many microgreens. This means you can grow greens in your home, organically, without ever having to dig up the ground! All you have to do is water and care for your crop as you would any other salad greens. This bundle contains 2 books: Book 1 covers:
