Documentary Storytelling has reached filmmakers and filmgoers worldwide with its unique focus on the key ingredient for success in the growing global documentary marketplace: storytelling. This practical guide reveals how today's top filmmakers bring the tools of narrative cinema to the world of nonfiction film and video without sacrificing the rigor and truthfulness that give documentaries their power. The book offers practical advice for producers, directors, editors, cinematographers, writers and others seeking to make ethical and effective films that merge the strengths of visual and aural media with the power of narrative storytelling. In this new, updated edition, Emmy Award-winning author Sheila Curran Bernard offers: New strategies for analyzing documentary work New conversations with filmmakers including Stanley Nelson (The Black Panthers), Kazuhiro Soda (Mental), Orlando von Einsiedel (Virunga), and Cara Mertes (JustFilms) Discussions previously held with Susan Kim (Imaginary Witness), Deborah Scranton (The War Tapes), Alex Gibney (Taxi to the Dark Side), and James Marsh (Man on Wire).

This book covers some recent advances in string theory and extra dimensions. Intended mainly for advanced graduate students in theoretical physics,

it presents a rare combination of formal and phenomenological topics, based on the annual lectures given at the School of the Theoretical Advanced Study Institute (2001) OCo a traditional event that brings together graduate students in high energy physics for an intensive course of advanced learning. The lecturers in the School are leaders in their fields. The first lecture, by E DOCOHoker and D Freedman, is a systematic introduction to the gaugeOCogravity correspondence, focusing in particular on correlation functions in the conformal case. The second, by L Dolan, provides an introduction to perturbative string theory, including recent advances on backgrounds involving Ramond-Ramond fluxes. The third, by S Gubser, explains some of the basic facts about special holonomy and its uses in string theory and M-theory. The fourth, by J Hewett, surveys the TeV phenomenology of theories with large extra dimensions. The fifth, by G Kane, presents the case for supersymmetry at the weak scale and some of its likely experimental consequences. The sixth, by A Liddle, surveys recent developments in cosmology, particularly with regard to recent measurements of the CMB and constraints on inflation. The seventh, by B Ovrut, presents the basic features of heterotic M-theory, including constructions that contain the Standard Model. The eighth, by K Rajagopal, explains the recent advances in understanding QCD at low temperatures and high densities in terms of color superconductivity. The ninth, by M Sher, summarizes grand unified theories and baryogenesis, including discussions of supersymmetry breaking and the Standard Model Higgs mechanism. The tenth, by M Spiropulu, describes collider physics, from a survey of current and future machines to examples of data analyses relevant to theories beyond the Standard Model. The eleventh, by M Strassler, is an introduction to supersymmetric gauge theory, focusing on Wilsonian renormalization and analogies between three- and four-dimensional theories. The twelfth, by W Taylor and B Zwiebach, introduces string field theory and discusses recent advances in understanding open string tachyon condensation. The thirteenth, by D Waldram, discusses explicit model building in heterotic M-theory, emphasizing the role of the E8 gauge fields. The written presentation of these lectures is detailed yet straightforward, and they will be of use to both students and experienced researchers in high-energy theoretical physics for years to come. The proceedings have been selected for coverage in: . OCo Index to Scientific & Technical Proceedings (ISTP CDROM version / ISI Proceedings). OCo CC Proceedings OCo Engineering & Physical Sciences."

How does the mind work? How do human beings perceive and analyze the various aspects of the world around them? Are occasional misinterpretations inevitable, given the way the brain functions? In this book, a distinguished psychologist describes the most important and up-to-date explanations of our mental processes. Designed specifically for a general audience, the book is written in an accessible and lively style and draws on a wide range of familiar situations to illustrate the concepts it presents. Anthony J. Sanford discusses such intriguing topics as memory, reasoning, learning, and problem solving. In each case, he describes the relevant theories and experiments of cognitive science and psychology and shows how they have increased our knowledge. Sanford explains, for example, that language, thinking, intuition, and judgment depend heavily on mental models (existing memory structures that can be used as analogies to understand a new situation). He considers mental models from two points of view: the first seeks to evaluate the processes underlying some of the variety of human understanding; the second examines limitations and errors in thought and imagination that occur as a natural by-product of normal human understanding. Original, comprehensive, and fascinating, this book will be of interest to students, faculty, and lay people alike. "This book is an excellent introduction to the structure of knowledge. It is very readable, clear, and illuminating without being highly technical." -R.L. Gregory, University of Bristol

Noisy popular liberal interventionism? Or a more conservative, diplomatic approach concentrating on co-operation between nations? This is the debate that lies at the heart of modern politics and Hurd traces its most interesting and influential exponents. He starts with Canning and Castlereagh in post Waterloo Britain; to a generation later, the victory of the interventionist Palmerston over Aberdeen; then to Salisbury (Imperialism) and Grey (European balance of power); and finally to Eden and Bevin who combined to lay the foundations of a post-war compromise. That delicate balance has served its purpose for over half a century, but as we enter a new era of terrorism and racial conflict, the old questions and divisions are re-surfacing . . .

The Cognitive Neuropsychiatry of Parkinson's Disease MIT Press

A detailed examination of the major neuropsychiatric syndromes of Parkinson's disease and a cognitive theory that accounts for their neurology and phenomenology. Patients with Parkinson's disease (PD) suffer most visibly with such motor deficits as tremor and rigidity and less obviously with a range of nonmotor symptoms, including autonomic dysfunction, mood disorders, and cognitive impairment. The neuropsychiatric disturbances of PD can be as disabling as its motor disorders; but they have only recently begun to be studied intensively by clinicians and scientists. In this book, Patrick McNamara examines the major neuropsychiatric syndromes of PD in detail and offers a cognitive theory that accounts for both their neurology and their phenomenology. McNamara offers an up-to-date review of current knowledge of such neuropsychiatric manifestations of PD as cognitive deficits, personality changes, speech and language symptoms, sleep disorders, apathy, psychosis, and dementia. He argues that the cognitive, mood, and personality symptoms of PD stem from the weakening or suppression of the agentic aspects of the self. McNamara's study may well lead to improved treatment for Parkinson's patients. But its overarching goal is to arrive at a better understanding of the human mind and its breakdown patterns in patients with PD. The human mind-brain is an elaborate and complex structure patched together to produce what we call the self. When we observe the disruption of the self structure that occurs with the various neuropsychiatric disorders associated with PD, McNamara argues, we get a glimpse into the inner workings of the most spectacular structure of the self: the agentic self, the self that acts.

How powerful new methods in nonlinear control engineering can be applied to neuroscience, from fundamental model formulation to advanced medical applications. Over the past sixty years, powerful methods of model-based control engineering have been responsible for such dramatic advances in engineering systems as autoland aircraft, autonomous vehicles, and even weather forecasting. Over those same decades, our models of the nervous system have evolved from single-cell membranes to neuronal networks to large-scale models of the human brain. Yet until recently control theory was completely inapplicable to the types of nonlinear models being developed in neuroscience. The revolution in nonlinear control engineering in the late 1990s has made the intersection of control theory and neuroscience possible. In *Neural Control Engineering*, Steven Schiff seeks to bridge the two fields, examining the application of new methods in nonlinear control engineering to neuroscience. After presenting extensive material on formulating computational neuroscience models in a control environment—including some fundamentals of the algorithms helpful in crossing the divide from intuition to effective application—Schiff examines a range of applications, including brain-machine interfaces and neural stimulation. He reports on research that he and his colleagues have undertaken showing that nonlinear control theory methods can be applied to models of single cells, small neuronal networks, and large-scale networks in disease states of Parkinson's disease and epilepsy. With *Neural Control Engineering* the reader acquires a working knowledge of the fundamentals of control theory and computational neuroscience sufficient not only to understand the literature in this transdisciplinary area but also to begin working to advance the field. The book will serve as an essential guide for scientists in either biology or engineering and for physicians who wish to gain expertise in these areas.

A survey of the latest research, covering such topics as plasticity in the adult brain and the underlying mechanisms of plasticity. The notion that neurons in the living brain can change in response to experience—a phenomenon known as "plasticity"—has become a major conceptual issue in neuroscience research as well as a practical focus for the fields of neural rehabilitation and neurodegenerative disease. Early work dealt with the plasticity of the developing brain and demonstrated the critical role played by sensory experience in normal development. Two broader themes have emerged in recent studies: the plasticity of the adult brain (one of the most rapidly developing areas of current research) and the search for the underlying mechanisms of plasticity—explanations for the cellular, molecular, and epigenetic factors controlling plasticity. Many scientists believe that achieving a fundamental understanding of what underlies neuronal plasticity could help us treat neurological disorders and even improve the learning capabilities of the human brain. This volume offers contributions from leaders in the field that cover all three approaches to the study of cerebral plasticity. Chapters treat normal development and the influences of environmental manipulations; cerebral plasticity in adulthood; and underlying mechanisms of plasticity. Other chapters deal with plastic changes in neurological conditions and with the enhancement of plasticity as a strategy for brain repair.

Community Impact Assessment

This guide was written as a quick primer for transportation professionals and analysts who assess the impacts of proposed transportation actions on communities. It outlines the community impact assessment process, highlights critical areas that must be examined, identifies basic tools and information sources, and stimulates the thought-process related to individual projects. In the past, the consequences of transportation investments on communities have often been ignored or introduced near the end of a planning process, reducing them to reactive considerations at best. The goals of this primer are to increase awareness of the effects of transportation actions on the human environment and emphasize that community impacts deserve serious attention in project planning and development-attention comparable to that given the natural environment. Finally, this guide is intended to provide some tips for facilitating public involvement in the decision making process.
