This is a unique book with a different aim from other books on the subject. The idea is to provide readers with the "big picture" first, yet at a level that helps further the study of physical chemistry. The text covers all the important topics in physical chemistry — thermodynamics, statistical thermodynamics, quantum chemistry, and chemical kinetics — staying rigorously close to the basic theory, using appropriate mathematics but avoiding long derivations. Moreover, the book is supplemented by a CD-ROM to make it more comprehensive, interactive and useful for a wider audience. The CD-ROM contains examples, extended discussion, exercises and details of important derivations to

reinforce understanding of physical chemistry.

A Chemist's Toolkit of Calculations John Wiley & Sons

General Chemistry: Atoms First, Second Edition starts from the building blocks of chemistry, the atom, allowing the authors to tell a cohesive story that progresses logically through molecules and compounds to help students intuitively follow complex concepts more logically. This unified thread of ideas helps students build a better foundation and ultimately gain a deeper understanding of chemical concepts. Students can more easily understand the microscopic-to-macroscopic connections between unobservable atoms and the observable behavior of matter in daily life, and are brought immediately into real chemistry—instead of being forced to memorize facts. Reflecting a true atoms first perspective, the Second Edition features experienced atoms-first authors, incorporates recommendations

from a panel of atoms-first experts, and follows historical beliefs in teaching chemistry concepts based and real experimental data first. This approach distinguishes this text in the market based whereby other authors teach theory first, followed by experimental data. Steve and Susan Zumdahl's texts focus on helping students build

critical thinking skills through the process of becoming independent problem-solvers. They help students learn to think like a chemists so they can apply the problem solving process to all aspects of their lives. In CHEMISTRY: AN ATOMS FIRST APPROACH, the Zumdahls use a meaningful approach that begins with the atom and proceeds through the concept of molecules, structure, and bonding, to more complex materials and their properties. Because this approach differs from what most students have experienced in high school courses, it encourages them to focus on conceptual learning early in the course, rather than relying on memorization and a plug and chug method of problem solving that even the best students can fall back on when confronted with familiar material. The atoms first organization provides an opportunity for students to use the tools of critical thinkers: to ask questions, to apply rules and models and to evaluate outcomes. Quantum Chemistry and Dynamics of Excited States New Leaf Publishing Group

In this volume, internationally renowned chemists recount their roles in the progress of chemistry research toward elucidation of biological processes. Beginning with a historical perspective on the development of X-ray crystallography, the reader is regaled with first-hand accounts of research milestones. Included are descriptions of the cutting-edge nuclear-magnetic-resonance and electron-paramagnetic-resonance spectroscopic techniques, the dynamics of ultra-fast reactions, and the central problem of molecular oxygen activation in biological processes. The roles of chiral auxiliaries in organic synthesis and of photochemistry in natural product synthesis are told, and innovations in combinatorial synthesis approaches are described. Contemporary issues in molecular recognition and modulation of molecular function are addressed, concluding with a missive regarding how the frontiers of medical ethics may be breached by molecular manipulations. The contributors, who number among the finest scientists in the world, including two Nobel Prize winners, are Peter B. Dervan, Jack D. Dunitz, Christian Griesinger, Jean-Marie Lehn, Thomas F. Prisner, Gerhard Quinkert, Peter G. Schultz, Helmut Schwarz, Dieter Seebach, and Ahmed Zewail. Additionally, there is a prologue by Albert Eschenmoser, for whom this collection was conceived, and an epilogue that contains facsimiles of notes from his landmark lecture 'Synthesis of Co-Enzyme B12: A Vehicle for Teaching Organic Synthesis'. This book is definitely a must for all who want to read, or to read again, where we stand in our chemical comprehension of the fascinating relationship between chemical structure and

biological processes, how we got here, and what the future might hold.
