 The pernicious effects of model misspecification on the properties of estimators have led to an expansion of nonparametric and semiparametric methods whose realm of application is widening very fast and that cover many different data situations. The fact that applied researchers have very little guidance as to how to choose functional forms and/or underlying distributions and that economic theory rarely gives any such guidance make nonparametric techniques an almost 'unavoidable' tool.

 Nonparametric. Intuitively, one would expect that, if n is large, then \hat{p} should be "close" to p . Indeed, one can easily show that the mean squared error (MSE) of \hat{p} is given by (see Exercise 1.3) $\text{def } p(1-p) \text{ MSE}(\hat{p}) = E(\hat{p} - p)^2 = \frac{p(1-p)}{n}$, so $\text{MSE}(\hat{p}) \rightarrow 0$ as $n \rightarrow \infty$, which is termed as \hat{p} converges to p in probability.
