Transboundary and Emerging Diseases of Animals Children's Press(CT)

This book explores the history and nature of our dependency on other animals and the implications of this for human and animal health. Writing from an historical and sociological perspective, Joanna Swabe's work discusses such issues as: * animal domestication * the consequences of human exploitation of other animals, including links between human and animal disease * the rise of a veterinary regime, designed to protect humans and animals alike * implications of intensive farming practices, pet-keeping and recent biotechnological developments. This account spans a period of some ten thousand years, and raises important questions about the increasing intensification of animal use for both animal and human health.

Studying animals in the environment may be a realistic and highly beneficial approach to identifying unknown chemical contaminants before they cause human harm. *Animals as Sentinels of Environmental Health Hazards* presents an overview of animal-monitoring programs, including detailed case studies of how animal health problems--such as the effects of DDT on wild bird populations--have led researchers to the sources of human health hazards. The authors examine the components and characteristics required for an effective animal-monitoring program, and they evaluate numerous existing programs, including in situ research, where an animal is placed in a natural setting for monitoring purposes.

The confirmed case of "mad cow" disease (BSE) in June 2005 illustrates the economic impact of disease outbreaks, as additional countries closed their markets to U.S. beef and beef products. Emerging diseases also threaten public health--11 out of 12 of the major global disease outbreaks over the last decade were from zoonotic agents (that spread from animals to humans).

Animal Health at the Crossroads: Preventing, Detecting, and Diagnosing Animal Diseases finds that, in general, the U.S. animal health framework has been slow to take advantage of state-of-the-art technologies being used now to protect public health; better diagnostic tests for identifying all animal diseases should be made a priority. The report also recommends that the nation establish a high-level, authoritative, and accountable coordinating mechanism to engage and enhance partnerships among local, state, and federal agencies, and the private sector.

Introduction: Although zoonoses are of increasing public and veterinary health concern, and the 'One Health' initiative has intensified demand for collaborative zoonoses surveillance, most human and animal disease surveillance systems operate independently. The purpose of this study was to demonstrate the feasibility of integrated approaches to passive zoonoses surveillance in Washington (WA) State, and to explore their potential to improve disease prevention, control, and treatment actions. Methods: We linked and analyzed data on endemically acquired leptospirosis and psittacosis cases in animals and humans reported to the WA State Department of Agriculture and the WA State Department of Health, respectively, from 1993-2016. Results: A significantly higher average number of human and animal leptospirosis reports per month were made from August-December than from January-July. For both diseases, the majority of cases were reported in counties with higher human and pet population densities. Higher pet dog population was associated with increased risk of a human case of leptospirosis in the same county and year, and higher pet bird population and the report of an avian case were associated with increased risk of a human case of psittacosis, although the positive predictive value and sensitivity for an avian case were low. The estimated incidence of psittacosis in pet bird owners and pet shop workers was substantially higher than for all state residents combined. Conclusions: The results of this study may help WA State public and veterinary health officials target disease prevention and control interventions at seasons, counties, and populations at highest risk of infection.

It is organized around major components of animal use: Key concepts of animal care and use. The Guide sets the framework for the humane care and use of laboratory animals. Animal care and use program. The Guide discusses the concept of a broad Program of Animal Care and Use,

including roles and responsibilities of the Institutional Official, Attending Veterinarian and the Institutional Animal Care and Use Committee. Animal environment, husbandry, and management. A chapter on this topic is now divided into sections on terrestrial and aquatic animals and provides recommendations for housing and environment, husbandry, behavioral and population management, and more. Veterinary care. The Guide discusses veterinary care and the responsibilities of the Attending Veterinarian. It includes recommendations on animal procurement and transportation, preventive medicine (including animal biosecurity), and clinical care and management. The Guide addresses distress and pain recognition and relief, and issues surrounding euthanasia. Physical plant. The Guide identifies design issues, providing construction guidelines for functional areas; considerations such as drainage, vibration and noise control, and environmental monitoring; and specialized facilities for animal housing and research needs. The Guide for the Care and Use of Laboratory Animals provides a framework for the judgments required in the management of animal facilities. This updated and expanded resource of proven value will be important to scientists and researchers, veterinarians, animal care personnel, facilities managers, institutional administrators, policy makers involved in research issues, and animal welfare advocates.

Pet Ownership - Are You Ready? asks important questions about the responsibility of pet ownership. Dogs on the Navajo Reservation are seen wandering about, starving and sometimes sick. Why is this allowed to happen? Who is responsible? What exactly is a pet? Culturally, how is the dog viewed? Can these problems be overcome? These are some of the questions asked in this animal based curriculum which is part of the RUFF Program, Reservations Unwanted Four-Footed Friends. Students examine different social issues and asked what they could do. Responsibility is discussed as well as health issues and diseases that can be spread from unhealthy dogs and cats. Questions such as; what makes a good pet? What is not a good pet? How important is it to vaccinate a pet? How important is safety for humans and pets? These questions are asked and used as prompts to encourage cooperative thinking. Along with problem solving skills this is a great way to teach social studies

and the ability to bring a change in attitude.

Surveillance, early detection, control and eradication of notifiable animal diseases is of critical importance for countries in order to maintain or improve their animal health status. This requires the collaboration of all stakeholders involved including animal health authorities, livestock industry and veterinary research institutions among others. Prevention, control and eradication programs must take into account the characteristics of the host (including potential reservoirs), the pathogen (transmissibility, virulence...) and the environment (temperature, animal density...) but also the socio-economic context in which they have to be implemented (highly influenced by funding availability), while at the same time guaranteeing compliance with international trade regulations. This has led to the adoption of a wide range of approaches to address the risk posed by specific pathogens in different countries, and at the same time similar strategies have yielded very different results in different regions. This Research Topic includes a variety of manuscripts focusing on different aspects of surveillance, control and eradication of diseases of critical importance for livestock, including cattle, swine and wildlife, in an attempt to provide an overview of the current situation in different countries.

Pathology of Wildlife and Zoo Animals is a comprehensive resource that covers the pathology of wildlife and zoo species, including a wide scope of animals, disease types and geographic regions. It is the definitive book for students, biologists, scientists, physicians, veterinary clinicians and pathologists working with non-domestic species in a variety of settings. General chapters include information on performing necropsies, proper techniques to meet the specialized needs of forensic cases, laboratory diagnostics, and an introduction into basic principles of comparative clinical pathology. The taxon-based chapters provide information about disease in related groups of animals and include descriptions of gross and histologic lesions, pathogenesis and diagnostics. For each group of animals, notable, unique gross and microscopic anatomical features are provided to further assist the reader in deciding whether differences from the domestic animal paradigm are "normal." Additional online content, which includes text, images, and whole scanned glass

slides of selected conditions, expands the published material resulting in a comprehensive approach to the topic. Presents a single resource for performing necropsies on a variety of taxa, including terrestrial and aquatic vertebrates and invertebrates. Describes notable, unique gross and microscopic anatomical variations among species/taxa to assist in understanding normal features, in particular those that can be mistaken as being abnormal. Provides consistent organization of chapters with descriptions of unique anatomic features, common non-infectious and infectious diseases following brief overviews of the taxonomic group. Contains full-color, high quality illustrations of diseases. Links to a large online library of scanned slides related to topics in the book that illustrate important histologic findings.

This is a concise and quick reference guide, clinically oriented, based on experience underpinned by published research data. The systems-based approach emphasizes the problem list process utilized by most practitioners when faced with a patient presenting with a single or variety of clinical symptoms. This allows generation of a complete list of infectious disease differentials, and the ability to include or exclude those indicated based on patient risk assessment. Pathogen specific information enables rational choice of diagnostics, therapy, and prognostication for a complete list of small animal infectious disease that includes bacterial, viral, parasitic/protozoal and fungal.

There is currently a lot of interest within veterinary medicine in both dermatology and exotics, yet, despite this interest, there is no single text available that focuses on both these key areas. This book, for the first time, provides a practical guide to dermatological problems in birds, reptiles, fish and mammals. Divided into the four groups, each section has a chapter introducing the structure and function of the skin of each group, a chapter on examination and diagnostic tests, and further chapters on species specific skin diseases and treatments. Written in a quick reference format and including almost 200 colour photographs, this book is a handy resource for veterinary practitioners, veterinary students and veterinary dermatologists alike.

Modern transportation allows people, animals, and plants--and the pathogens they carry--to travel more easily than ever before. The ease and speed of travel, tourism, and international trade connect once-remote areas with one another, eliminating many of the geographic and cultural barriers that once limited the spread of disease. Because of our global interconnectedness through transportation, tourism and trade, infectious diseases emerge more frequently; spread greater distances; pass more easily between humans and animals; and evolve into new and more virulent strains. The IOM's Forum on Microbial Threats hosted the workshop "Globalization, Movement of Pathogens (and Their Hosts) and the Revised International Health Regulations" December 16-17, 2008 in order to explore issues related to infectious disease spread in a "borderless" world. Participants discussed the global emergence, establishment, and surveillance of infectious diseases; the complex relationship between travel, trade, tourism, and the spread of infectious diseases; national and international policies for mitigating disease movement locally and globally; and obstacles and opportunities for detecting and containing these potentially wide-reaching and devastating diseases. This document summarizes the workshop. *Sustaining Global Surveillance and Response to Emerging Zoonotic Diseases* Elsevier Health Sciences
Diseases of Man Acquired from his Pets

provides guideline of the diseases that man may acquire from animals. This book is composed of nine chapters. The chapters are divided broadly into the types of animals kept as pets. This book begins with a general introduction to animal pets. The subsequent chapters deal with diseases acquired from carnivores, birds, and rodents, with a particular emphasis on leptospirosis, which affects rodents, carnivores, farm animals, man and, to a limited extent, birds. These chapters discuss the epidemiology, clinical signs, symptoms and treatment of this infection ...
